

Q When will results be noticed and how long will they last?

Immediately. When patients leave the office following treatment, changes are remarkable - deep facial creases are smoother and thin lips are plumper. Some swelling may occur during or right after treatment, but within just a few days you will see the true results—that tend to be long-lasting.

The unique crystal-gel technology helps maintain treatment results of Restylane until the injected material is mostly broken down by the body - meaning, just a single Restylane treatment can yield beautiful results for up to six months or longer.

This is nearly twice as long as typical collagen results - and, without the risk of allergic reaction associated with collagen treatments!

Q Are Restylane and BOTOX® cosmetic the same?

No! Restylane adds volume to smooth facial wrinkles, creases and folds. Botox also smoothes wrinkles but works differently. Botox works remarkably well for the wrinkles caused by facial expressions. It helps relax the muscles that underly the “laugh” or “frown” lines to temporarily soften the appearance of these wrinkles.

Restylane & Botox are often used together, but consultation with Dr. Berkowitz will further clarify which product would better satisfy your rejuvenation goals.

Q Are Restylane and collagen the same?

NO! Restylane and collagen are both dermal fillers—meaning they are both used for similar cosmetic corrections and produce similar results. However, Restylane does not require allergy testing (as collagen does) and has longer lasting results.

We are gladly accepting new Restylane patients and hope to soon be able to help accentuate your natural beauty.
