

*Before (top photo) and 6 Months After Laser Eyelid Rejuvenation*

*“As a nurse, when I decided to have surgery I asked all my friends who were doctors and nurses, “who was the best?” Dr. Berkowitz was the name they said was the best.*

*I have had 2 surgeries and several other procedures and will continue to see Dr. Berkowitz and his excellent staff for all my needs.”*

*- Evelyn D., New Baltimore*

**Why have surgery now if your insurance company may pay in the future (if your sagging eyelids block your vision)?**

Surgical correction is an incredibly wise investment. The great majority of patients are thrilled with the results even before they are fully recovered and often express disappointment in not having surgery years ago.

And, the puffiness and dark, wrinkled bags under your eyes are always a cosmetic enhancement—meaning your insurance company will not likely consider this correction a covered service. Yet, you will look years younger.

**Should you have both upper and lower eyelids done together?**

You can have either the upper or lower eyelids done together or separately. If your problem areas are more prominent in one region then you will only need one area done. However, most patients find they get more dramatic results and a more symmetrical appearance if both areas are done at the same time.

**Does laser eyelid rejuvenation surgery hurt?**

With the use of an anesthetic you will experience almost no discomfort during the procedure. Following the surgery, your post-operative pain is very slight. Most patients need nothing more than Tylenol and ice to ease any pain or discomfort.

**How long will surgery take?**

The length of time needed depends on if you are having both upper and lower eyelids done. Usually your procedure will only take about an hour to 90 minutes.

**Are there any scars?**

Scarring is very minimal in the upper eyelid area because the incision is made in the natural creases and folds of the eyelids. Typically after a few months the fine scar becomes an almost invisible white line. There is absolutely no visible scar on the lower lid.

**Can eyelid surgery get rid of my wrinkles and crow's feet?**

No! Blepharoplasty cannot get rid of wrinkles or crow's feet. Other procedures such as laser resurfacing and Botox injections can be used to solve these concerns. Fortunately for our patients, resurfacing is included (when appropriate) at no extra charge when Dr. Berkowitz performs lower lid surgery.
