

CHEMICAL PEELS

Chemical Peels offer remarkable results when used to:

- ♦ Reduce fine lines and wrinkles
- ♦ Control acne breakouts
- ♦ Fade discolorations from sun damage & hormonal changes (such as mask of pregnancy)
- ♦ Rejuvenate aging skin
- ♦ Blend uneven skin texture

Chemical peels use specially formulated solutions to treat damaged skin. They may safely be applied to the entire face or specific areas—such as the mouth or forehead. As healing occurs following treatment new cells form and produce tighter, more youthful-looking skin.

Because many different types of chemical peels are available, we will fully discuss the benefits, risks and differences.

CORRECTIVE FACIALS

Corrective Facials use customized treatments and skin care products to:

- ♦ Balance oily skin
- ♦ Nourish & renew aging skin
- ♦ Control acne outbreaks
- ♦ Calm irritated, sensitive skin
- ♦ Blend uneven skin texture
- ♦ Hydrate dull skin

All facials follow a basic regimen of cleansing the skin, deep cleaning the pores, exfoliating damaged skin cells, increasing circulation with massage, treating specific complexion issues and protecting the skin from environmental irritants. Facials are remarkably relaxing and you will find the session well worth your time and money—as will your skin.

PHOTO THERAPIES

Photo Therapies use light and heat energies to significantly improve complexion flaws and to remove unwanted hair. Pulses of these combined energies are applied to the skin by a hand-piece, delivering treatment at different depths within the skin with minimal discomfort and no recovery time or restrictions.

Photo Therapies are performed to:

- ♦ Remove unwanted hair
- ♦ Improve firmness, tone & texture
- ♦ Fade dark spots and visible sun damage
- ♦ Control rosacea and acne outbreaks
- ♦ Conceal micro-spider veins

Several treatments are recommended for significant and longer-lasting improvements, and follow-up will likely be needed periodically to maintain any changes.

Control rosacea & spider veins | Photo Therapies reduce the redness and flushed appearance associated with rosacea. Light and heat energies are also able to reduce the appearance of thin spider veins. These energies are absorbed by the abnormal dilated vessels or uneven pigment, causing natural healing to occur. Following a series of treatments, rosacea patients will likely reduce - or eliminate - the need for topical creams and oral medication - and patients with spider veins or broken capillaries will surely enjoy no longer being self-conscious.

Photo aging & sun-damage | Exposure to the sun over time will likely cause dark spots and uneven pigment to occur. Similar to treating the rosiness of rosacea, photo therapies target dark pigment and cause these cells to break down - which allows the skin's natural pigment color to return.

Long-term hair removal | Electrolysis is a tedious, invasive, and painful process of destroying unwanted hair one at a time and often requires years of treatment. In contrast, the Skin Station's energy can effectively treat hundreds of hairs at the same time. Several treatments may be needed, depending upon the hair color, location, and growth cycle. Patients are able to resume normal activities immediately after treatment and are not likely to experience side effects other than mild redness or swelling at the treatment site.
